A DBA of Naturally Natasha LLC

Where Clinical Precision Meets Strategic Jurisprudence.

Naturally Natasha™ Medical-Evidentiary Risk Index

NN-MERI™ — Client Overview & Framework Reference

WHAT IS THE NN-MERI™?

The Naturally Natasha™ Medical-Evidentiary Risk Index (NN-MERI™) is a proprietary clinical forensic assessment framework developed exclusively by Naturally Natasha™ Consulting. Delivered as a standard component of every clinical engagement, including the Phase 1 Merit Screening and Comprehensive Medical Chronology, the NN-MERI™ translates complex medical record findings into a clear, attorney-actionable risk tier — enabling immediate, informed litigation strategy decisions at case intake.

THE THREE EVALUATION DOMAINS

Every NN-MERI™ assessment evaluates the medical record across three core clinical forensic domains. The specific analytical criteria and weighting methodology within each domain constitute protected intellectual property of Naturally Natasha™ Consulting and are not disclosed in client deliverables.

DOMAIN 1	DOMAIN 2	DOMAIN 3
Clinical Protocol & Standard of Care Adherence	Documentation Integrity & EHR Vulnerability Analysis	Proximate Causation & Systemic Progression
Evaluates whether institutional care protocols, evidence-based standards, and facility policies were fully executed throughout the patient encounter.	Cross-examines the completeness, chronological integrity, and metadata authenticity of the EHR to identify documentation anomalies, gaps, or retroactive entries.	Assesses whether institutional negligence directly caused, accelerated, or worsened the adverse outcome — including biological timeline analysis and comorbidity weighting.

NN-MERI™ RISK TIER DEFINITIONS

RISK TIER	CLINICAL EVIDENCE PROFILE	EVIDENTIARY FOUNDATION & LITIGATION POSTURE
■ CRITICAL EXPOSURE	Severe, unmitigated standard-of-care deviations; profound clinical monitoring gaps; structural timeline impossibilities; or clear audit trail and metadata anomalies indicating retroactive entry.	Strong. The institutional documentation contains critical vulnerabilities that directly align with an accelerative or causative mechanism of injury. High probability of systemic liability.
■ CONDITIONAL EXPOSURE	Documented clinical deviations are present, but confounded by advanced pre-existing comorbidities or complex multi-system physiological decline that defense counsel can leverage to complicate true causation.	Equivocal. Technical breaches exist, but establishing direct proximate cause requires focused deposition mapping to isolate the exact clinical pivot point of injury.
■ DEFENSIBLE RECORD	The adverse outcome, while tragic, aligns with known, documented, inherent clinical risks. Institutional protocols were fully executed and care transitions met established physiological discharge triggers.	Poor. The medical record is structurally sound and highly defensible. Mitigates risk for counsel by identifying non-meritorious claims early to prevent sunk operational capital.

HOW TO USE YOUR NN-MERI™ ASSESSMENT

■ CRITICAL EXPOSURE

Pursue aggressive discovery immediately. Prioritize subpoena of native EHR audit trails, internal risk management logs, and staffing matrices. Strong foundation for plaintiff litigation or defense escalation response.

■ CONDITIONAL EXPOSURE

Invest in targeted deposition mapping to isolate the clinical pivot point. Commission additional expert analysis on comorbidity weighting before committing full litigation capital.

■ DEFENSIBLE RECORD

Decline or settle early. The record is structurally sound. Proceeding to full litigation exposes counsel to significant sunk capital with low probability of favorable outcome.

The NN-MERI™ assessment framework, scoring methodology, domain criteria, and analytical weighting system constitute protected intellectual property of Naturally Natasha™ Consulting. Tier placements reflect the professional clinical forensic opinion of Natasha Nicole Davis, DNP, MSN, RN and do not constitute legal advice.
